

# SEFS LAB HPC COMMAND CHEAT SHEET

General command guide for NC State HPC (Hazel) using Slurm scheduler

Cluster access: `ssh <unityid>@login.hpc.ncsu.edu` | OS: RHEL 9.2

Author: Michelle Pretorius | Updated: Aug 2026 | Scheduler: Slurm

## 1. FILESYSTEMS & STORAGE DIRECTORIES

| Location | Path & Quota                                                               | Purpose / Policy                                                                 |
|----------|----------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Home     | <code>~/</code> or <code>/home/&lt;unityid&gt;</code><br><b>1 GB QUOTA</b> | Scripts, small apps. Backed up daily.                                            |
| Scratch  | <code>/share/doserlab/&lt;unityid&gt;</code><br><b>20 TB QUOTA</b>         | Job execution, raw results. <b>Not backed up!</b> Purged after 30 days inactive. |
| App dir  | <code>/usr/local/usrapps/doserlab/jwdoser</code>                           | SEFS Lab shared software and R packages repository.                              |
| Research | <code>/rs1</code> or <code>/rsstu</code><br><b>2TB - 30TB</b>              | Long-term project data storage across nodes.                                     |

## 2. CONNECTION & INTERACTIVE SFTP

| Command                                                                     | Description                                                    |
|-----------------------------------------------------------------------------|----------------------------------------------------------------|
| <code>ssh &lt;unityid&gt;@login.hpc.ncsu.edu</code>                         | Log in to Hazel via SSH (requires Duo 2FA).                    |
| <code>sftp &lt;unityid&gt;@login.hpc.ncsu.edu</code>                        | Open interactive secure file transfer session.                 |
| <code>exit</code> / <code>Ctrl+D</code>                                     | Terminate SSH or SFTP connection.                              |
| <code>hostname</code>                                                       | Identify current node ( <code>loginXX</code> vs compute node). |
| <code>whoami</code> / <code>clear</code>                                    | Print active UnityID / Clear terminal screen.                  |
| <b>Interactive SFTP sub-commands (inside <code>sftp&gt;</code> prompt):</b> |                                                                |
| <code>put &lt;local&gt; &lt;remote&gt;</code>                               | Upload file to HPC (add <code>-r</code> for folders).          |
| <code>get &lt;remote&gt; &lt;local&gt;</code>                               | Download file from HPC (add <code>-r</code> for folders).      |
| <code>lcd &lt;path&gt;</code> / <code>lpwd</code>                           | Change/print working directory on <b>local machine</b> .       |

## 3. DIRECTORY & FILE OPERATIONS

| Command                                | Description / Key Options                                              |
|----------------------------------------|------------------------------------------------------------------------|
| <code>pwd</code>                       | Print current full working directory path.                             |
| <code>cd &lt;path&gt;</code>           | Change directory ( <code>cd ~</code> home, <code>cd ..</code> parent). |
| <code>ls -ltr</code>                   | List files in long format sorted by modification time.                 |
| <code>mkdir &lt;folder&gt;</code>      | Create a new directory ( <code>rmdir</code> removes empty dir).        |
| <code>nano &lt;file&gt;</code>         | Command-line text editor ( <code>Ctrl+X</code> to exit/save).          |
| <code>cat &lt;file&gt;</code>          | Print entire file contents to terminal screen.                         |
| <code>head -n 20 &lt;f&gt;</code>      | Print first 20 lines of a file.                                        |
| <code>tail -f &lt;f&gt;</code>         | Print last 10 lines of a file ( <code>-f</code> monitors live).        |
| <code>less &lt;file&gt;</code>         | Page through file line-by-line (press <code>q</code> to exit).         |
| <code>grep "str" &lt;f&gt;</code>      | Search pattern inside file (e.g. <code>ls   grep txt</code> ).         |
| <code>cp -r &lt;s&gt; &lt;d&gt;</code> | Copy file or directory ( <code>-r</code> recursive).                   |
| <code>mv &lt;s&gt; &lt;d&gt;</code>    | Move or rename a file or directory.                                    |
| <code>rm &lt;file&gt;</code>           | Permanently delete file ( <b>Warning: cannot undo!</b> ).              |

## 4. QUOTA & MODULE MANAGEMENT

| Command                    | Description                                                            |
|----------------------------|------------------------------------------------------------------------|
| <code>quota -s</code>      | Display home directory quota and space used.                           |
| <code>quota_display</code> | NC State utility to check group scratch quota on <code>/share</code> . |
| <code>du -sh .</code>      | Summarize total space used by current directory.                       |
| <code>module avail</code>  | List all software modules available on Hazel.                          |
| <code>module load R</code> | Load specific module into active session (e.g. R, gcc).                |
| <code>module list</code>   | Show software modules currently loaded.                                |
| <code>module purge</code>  | Unload <b>all</b> modules (best practice at start of scripts).         |

# SEFS LAB HPC COMMAND CHEAT SHEET

General command guide for NC State HPC (Hazel) using Slurm scheduler

Cluster access: `ssh <unityid>@login.hpc.ncsu.edu` | OS: RHEL 9.2

Author: Michelle Pretorius | Updated: Aug 2026 | Scheduler: Slurm

## 5. SLURM BATCH SCRIPT DIRECTIVES (#SBATCH)

| Directive Flag                      | Description / Example                                                          |
|-------------------------------------|--------------------------------------------------------------------------------|
| <code>-job-name=&lt;name&gt;</code> | Name displayed in queue (e.g. <code>myjob</code> ).                            |
| <code>-output=stdout.%j</code>      | Standard output log file ( <code>%j</code> = JOBID).                           |
| <code>-error=stderr.%j</code>       | Standard error log file.                                                       |
| <code>-ntasks=1</code>              | Number of tasks/processes (MPI ranks).                                         |
| <code>-cpus-per-task=4</code>       | Number of CPU cores per task (threads).                                        |
| <code>-nodes=1</code>               | Number of compute nodes requested.                                             |
| <code>-time=04:00:00</code>         | Wall clock limit ( <code>HH:MM:SS</code> or <code>D-HH:MM:SS</code> ).         |
| <code>-mem=16G</code>               | Memory per node (e.g., <code>16G</code> or <code>16000M</code> ).              |
| <code>-partition=compute</code>     | Partition selection: <code>compute</code> (CPU) or <code>gpu</code> .          |
| <code>-qos=normal</code>            | QOS tier: <code>normal</code> (max 4 days) or <code>long</code> (max 10 days). |
| <code>-array=1-10</code>            | Submit job array with task indices 1 through 10.                               |

## 6. TEMPLATE SLURM BATCH SCRIPT

```
#!/bin/bash
#SBATCH --job-name=myjob
#SBATCH --output=stdout.%j
#SBATCH --error=stderr.%j
#SBATCH --ntasks=1
#SBATCH --cpus-per-task=4
#SBATCH --time=02:00:00
#SBATCH --mem=16G
#SBATCH --partition=compute
#SBATCH --qos=normal

# Explicitly switch to submission directory
cd $SLURM_SUBMIT_DIR

# Clean environment & load modules
module purge
module load R

# Execute R script
Rscript ~/scripts/my_model.R
```

## 7. SLURM JOB MANAGEMENT COMMANDS

| Command                             | Description                                                       |
|-------------------------------------|-------------------------------------------------------------------|
| <code>sbatch submit.sh</code>       | Submit batch script to Slurm execution queue.                     |
| <code>salloc</code>                 | Start an interactive session on a compute node.                   |
| <code>srun &lt;exec&gt;</code>      | Launch parallel job step (MPI) or command.                        |
| <code>squeue</code>                 | View status ( <code>ST</code> ) of your queued/running jobs.      |
| <code>sjs &lt;JOBID&gt;</code>      | View live CPU %, RAM, and disk I/O for running job.               |
| <code>scancel &lt;JOBID&gt;</code>  | Cancel running job ( <code>scancel -u \$USER</code> cancels all). |
| <code>sacct -j &lt;JOBID&gt;</code> | View accounting details/exit state for completed job.             |
| <code>seff &lt;JOBID&gt;</code>     | Display CPU and memory efficiency utilization report.             |
| <code>sa</code>                     | Show user account allocations and allowed QOS.                    |
| <code>sqos</code>                   | View QOS policies, priorities, and max wall time.                 |
| <code>si</code>                     | Show compute node availability across partitions.                 |

## 8. SLURM STATES & ENVIRONMENT VARIABLES

| Code                | State            | Description                                                        |
|---------------------|------------------|--------------------------------------------------------------------|
| <code>PD</code>     | Pending          | Waiting for requested cluster resources or QOS slot.               |
| <code>R</code>      | Running          | Job is actively executing on allocated compute node(s).            |
| <code>CD</code>     | Completed        | Job finished successfully with exit code 0.                        |
| <code>F / TO</code> | Failed / Timeout | Non-zero exit code or exceeded requested <code>-time</code> limit. |
| <code>OOM</code>    | Out of memory    | Job process was killed for exceeding <code>-mem</code> limit.      |

### Slurm environment variables (used inside scripts):

|                                    |                                                        |
|------------------------------------|--------------------------------------------------------|
| <code>\$SLURM_SUBMIT_DIR</code>    | Directory path where <code>sbatch</code> was executed. |
| <code>\$SLURM_ARRAY_TASK_ID</code> | Current task index for Job Array (e.g. 1, 2, 3...).    |
| <code>\$SLURM_JOB_ID</code>        | Unique numeric ID assigned to the job.                 |
